FULFILLMENT

WHY CHOOSE PLASTIC?

“Several studies have shown many materials used as alternatives to plastic in packaging, such as cotton, glass, metal or bioplastics, to have significantly higher CO₂ impact or water usage compared to plastic packaging. On average over current food packaging, replacing plastic packaging with alternatives, would increase the weight of the packaging by 3.6 times, the energy use by 2.2 times, and the carbon dioxide emissions by 2.7 times.”

N. Voulvoulis et al., Examining Material Evidence – The Carbon Footprint, Centre for Environmental Policy, Imperial College London & Veolia UK, ACC, 2019
